Image formation

Let's design a camera

- Idea 1: put a piece of film in front of an object
- What will the image look like?

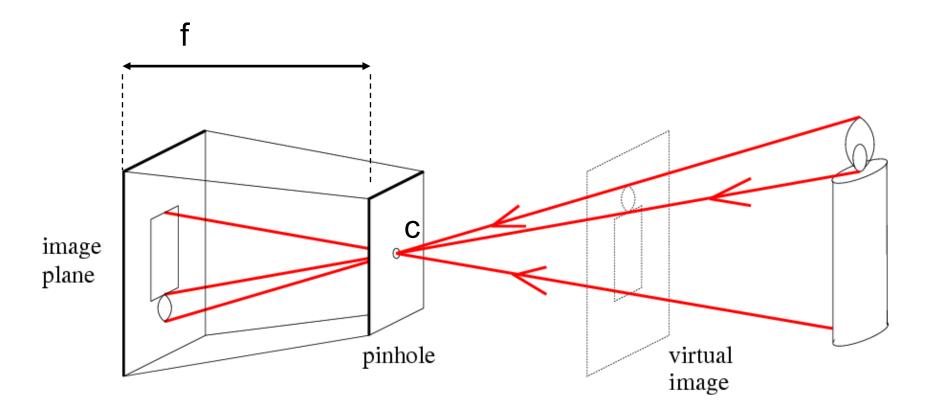

Pinhole camera

Idea 2: add a barrier to block off most of the rays

- Few rays from a point reach the film (small blur)
- The opening is called the aperture

Pinhole camera

f = focal length c = center of the camera

Camera obscura: the pre-camera

• First idea: Mozi, China (470BC to 390BC)

• First built: Alhacen, Iraq/Egypt (965 to 1039AD)

Projection can be tricky...

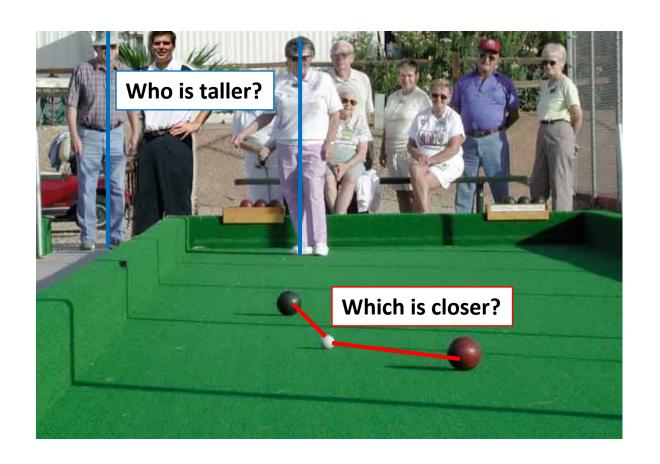

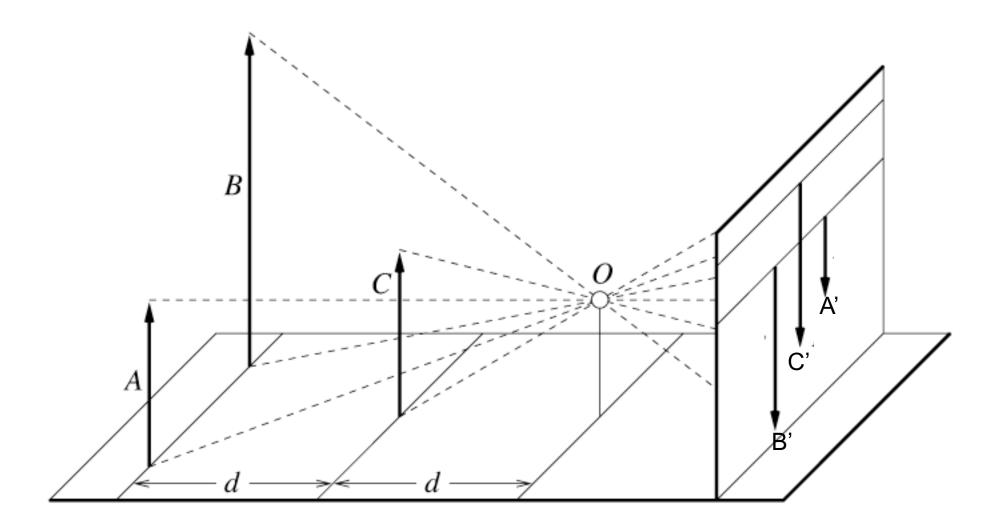

Projective Geometry

Length is not preserved

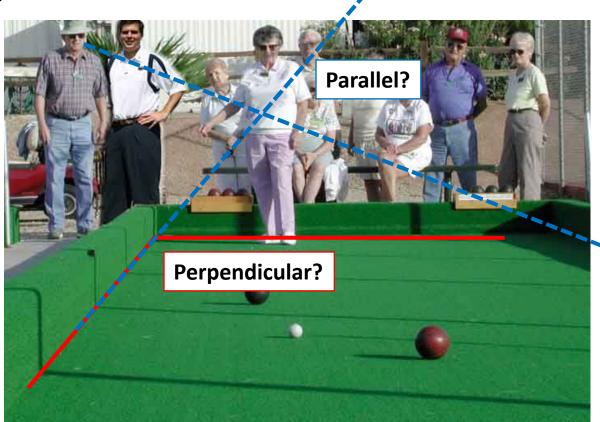

Projective Geometry

Projective Geometry

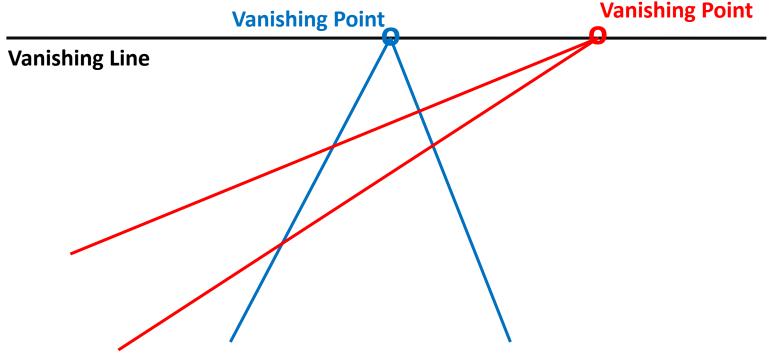

What is preserved?

• Straight lines are still straight

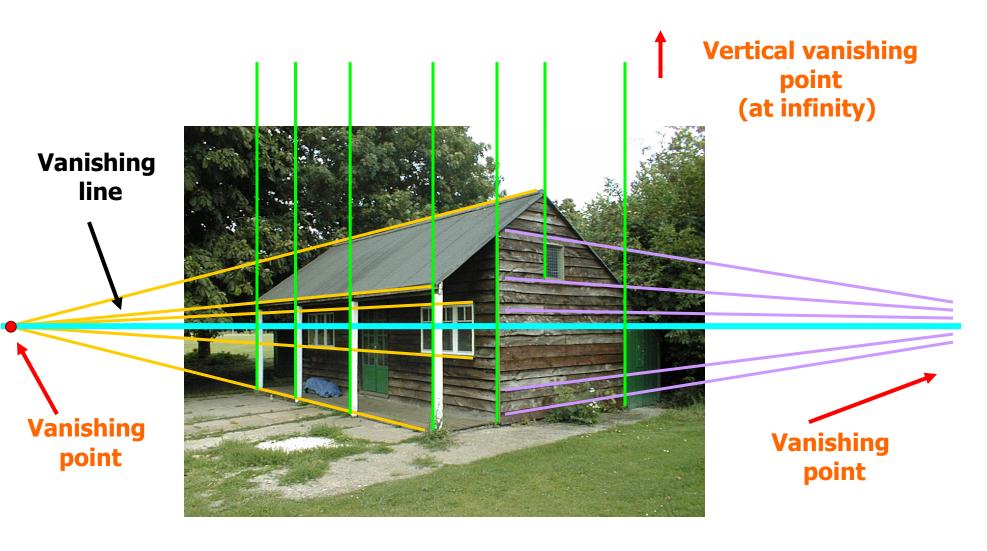

Parallel lines in the world intersect in the image at a "vanishing point"

- The projections of parallel 3D lines intersect at a vanishing point
- The projection of parallel 3D planes intersect at a vanishing line
- If a set of parallel 3D lines are also parallel to a particular plane, their vanishing point will lie on the vanishing line of the plane
- Not all lines that intersect are parallel
- Vanishing point <-> 3D direction of a line
- Vanishing line <-> 3D orientation of a surface

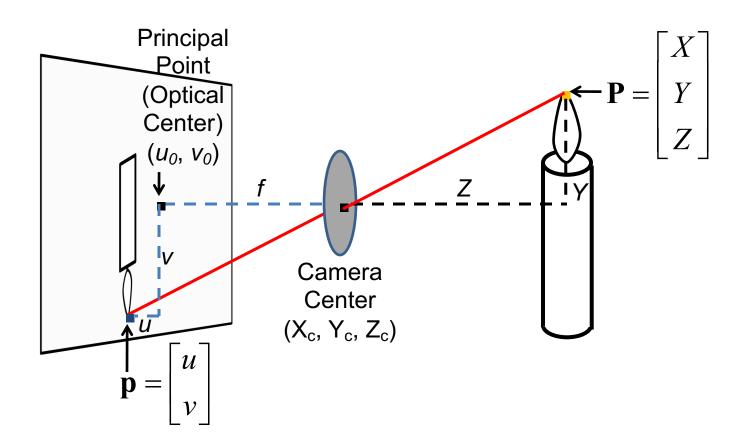

Vanishing objects

Projection: world coordinates image coordinates

Homogeneous coordinates

Conversion

Converting to homogeneous coordinates

$$(x,y) \Rightarrow \left[egin{array}{c} x \\ y \\ 1 \end{array} \right]$$

homogeneous image coordinates

$$(x,y) \Rightarrow \begin{bmatrix} x \\ y \\ 1 \end{bmatrix} \qquad (x,y,z) \Rightarrow \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix}$$

homogeneous scene coordinates

Converting from homogeneous coordinates

$$\begin{bmatrix} x \\ y \\ w \end{bmatrix} \Rightarrow (x/w, y/w) \qquad \begin{bmatrix} x \\ y \\ z \\ w \end{bmatrix} \Rightarrow (x/w, y/w, z/w)$$

Homogeneous coordinates

Invariant to scaling

$$k\begin{bmatrix} x \\ y \\ w \end{bmatrix} = \begin{bmatrix} kx \\ ky \\ kw \end{bmatrix} \Rightarrow \begin{bmatrix} \frac{kx}{kw} \\ \frac{ky}{kw} \end{bmatrix} = \begin{bmatrix} \frac{x}{w} \\ \frac{y}{w} \end{bmatrix}$$

Coordinates

Point in Cartesian is ray in Homogeneous

Basic geometry in homogeneous coordinates

• Line equation: ax + by + c = 0

$$line_i = \begin{vmatrix} a_i \\ b_i \\ c_i \end{vmatrix}$$

 Append 1 to pixel coordinate to get homogeneous coordinate

$$p_i = \begin{bmatrix} u_i \\ v_i \\ 1 \end{bmatrix}$$

Line given by cross product of two points

$$line_{ij} = p_i \times p_j$$

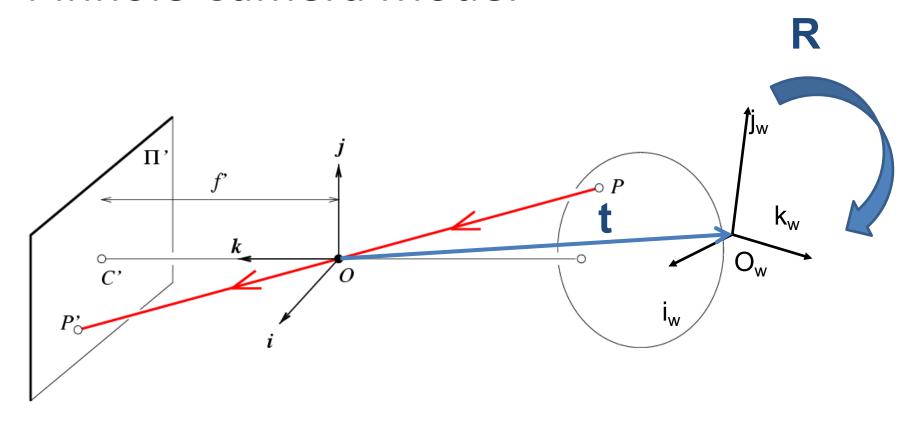

• Intersection of two lines given by cross product of the lines $q_{ii} = line_i \times line_i$

Another problem solved by homogeneous coordinates

Orthographic Projection

- Special case of perspective projection
 - Distance from the center of projection to the image plane is infinite

- Also called "parallel projection"
- What's the projection matrix?

$$\begin{bmatrix} u \\ v \\ 1 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 & u_0 \\ 0 & 1 & 0 & v_0 \\ 0 & 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix}$$

Scaled Orthographic Projection

- Special case of perspective projection
 - Object dimensions are small compared to distance to camera

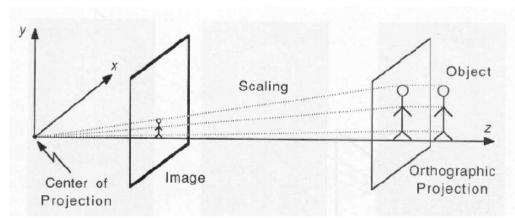

Illustration from George Bebis

- Also called "weak perspective"
- What's the projection matrix?

$$w\begin{bmatrix} u \\ v \\ 1 \end{bmatrix} = \begin{bmatrix} f & 0 & 0 & 0 \\ 0 & f & 0 & 0 \\ 0 & 0 & 0 & s \end{bmatrix} \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix}$$

 What is the camera axis in world coordinates given the extrinsic parameters R, t

• Suppose a camera at height y=h (x=0,z=0) observes a point at (u,v) known to be on the ground (y=0). Assume R is identity. What is the 3D position of the point in terms of f, u_0 , v_0 ?
